

Conditions for storage and transportation of powder coated products

In order to ensure the high quality of coating, the following conditions for storage and transportation shall be respected.

Procedure:

1. For transportation, the products shall be protected from damage by stretch foil or other type of foil.
2. After transportation, the protection foil shall be immediately removed by Purchaser. Foil has the sole purpose of protecting products during transportation.
3. It is not allowed to store products directly on the ground. During storage and transportation, wooden or steel washers shall be used. It is permissible to use cardboard washers if they do not have direct contact with water, moisture or other liquids. Keep in mind that the material of the washers shall be devoid of abrasive properties, as it may damage the coating or surface of the product.
4. While storing, products, especially powder coated items, shall be protected from precipitation and UV radiation. They shall be stored in dry airy spaces.

Note:

Foils contain chemical compounds which, when exposed to heat and humidity, can discolour the coating, therefore, once the transport is complete, the packing materials used shall be removed immediately to avoid moisture condensation between the coating and the packing foil
